UI/UX Practical 1

1. What is UI?

UI = User Interface

UI means everything the user sees and interacts with in a digital product.

For example, when you open an app, you see:

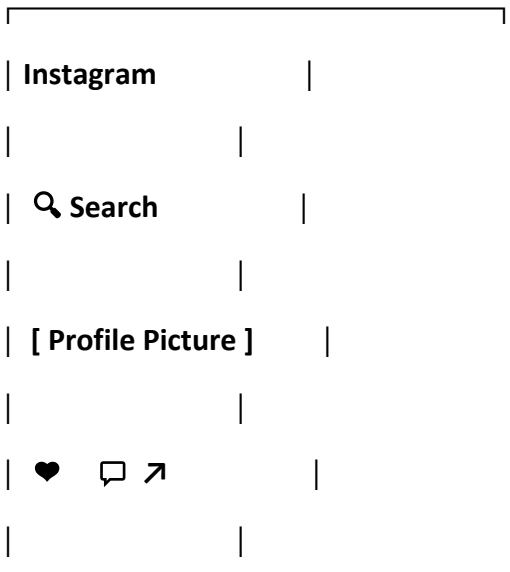

- **Buttons**
- **Text**
- **Images**
- **Colors**
- **Icons**
- **Menus**
- **Forms**
- **Input boxes**
- **Navigation bars**
- **Cards**
- **Sliders**

All of these are part of the User Interface.

Simple example

Think about Instagram.

The following are UI:

The colors, buttons, icons, fonts, layout **and screens are UI.**

In simple words:

UI is how a digital product looks and how its interface is presented to the user.

2. What is UX?

UX = User Experience

UX means the overall experience a user has while using a product or application.

It is not only about how the application looks.

It is about:

- **Is it easy to use?**
- **Can the user find what they need?**
- **Is navigation easy?**
- **Does the application respond properly?**
- **Is the information understandable?**
- **Can the user complete a task quickly?**
- **Is the application accessible?**
- **Does the user feel satisfied?**

3. Simple Example of UI vs UX

Imagine an online shopping application.

UI

The shopping app has:

- **Beautiful product images**
- **Attractive colors**
- **Nice buttons**
- **Good fonts**
- **Clean layout**

That is UI.

UX

Now imagine you want to buy shoes.

You:

Search shoes

↓

Filter by size

↓

Select product

↓

Check reviews

↓

Add to cart

↓

Make payment

↓

Order confirmed

If this process is easy and smooth, the application has good UX.

Assignment

“Apply 5 fundamental UI/UX principles (consistency, feedback, simplicity, visibility, accessibility) to redesign a basic form.”

We will make:

A **Student Registration Form**.

You will create **3 frames**:

FRAME 1 → Original Basic Form

FRAME 2 → Redesigned Form

FRAME 3 → Feedback / Error State

This will clearly demonstrate all 5 principles.

PART A — CREATE THE FIGMA FILE

You are already inside the Figma Design file, so start from your current screen.

Step 1 — Rename the Figma file

At the top of the screen you currently see:

Untitled

1. Click **Untitled**.
2. Select the file name.
3. Type:

UIUX Practical 1 - Student Registration

4. Press **Enter**.

PART B — CREATE FRAME 1

Step 2 — Select Frame Tool

At the bottom toolbar, you have several icons.

Look for the icon that looks like:

/ four corners

It is next to the pointer tool.

Click it.

Shortcut:

Press:

F

on your keyboard.

Step 3 — Create the Frame

Now your mouse cursor is the Frame tool.

Move to the black canvas.

Click and drag to create a rectangle.

Don't worry about getting the size perfect.

Step 4 — Set exact frame size

After creating the frame, look at the **right-side Design panel**.

You should see something similar to:

W

H

Set:

W = 1440

H = 900

If the frame is selected, you can enter these values directly.

Step 5 — Rename the frame

The frame should be named something like **Frame 1**.

Rename it:

01 - Original Form

PART C — DESIGN THE ORIGINAL FORM

The first form is intentionally basic.

We are going to create a simple student registration form.

Step 6 — Add the heading

Select the **Text tool**.

You can:

- Click the **T** icon in the bottom toolbar
- OR press **T**

Click near the top-left area inside your frame.

Type:

Student Registration

Step 7 — Set heading size

Select the text.

Look at the right-side panel.

Find **Font Size**.

Set:

Font: Inter

Size: 24

Make it **Bold**.

Step 8 — Add Full Name label

Press:

T

Click below the heading.

Type:

Full Name

Set:

Font: Inter

Size: 14

Step 9 — Create Full Name input box

Press:

R

This selects the Rectangle tool.

Draw a rectangle below:

Full Name

[_____]

Approximate size:

Width: 400 px

Height: 45 px

You can set the width and height from the right panel if necessary.

Step 10 — Add placeholder text

Press:

T

Click inside the rectangle.

Type:

Enter your full name

Set:

Font size: 14 px

Keep the text slightly away from the left edge of the box.

Step 11 — Create Email field

Repeat the same process.

Label:

Email Address

Input box:

[Enter your email]

Use approximately:

Width: 400 px

Height: 45 px

Step 12 — Create Mobile Number

Add label:

Mobile Number

Input:

[Enter mobile number]

Step 13 — Create Date of Birth

Label:

Date of Birth

Input:

[DD/MM/YYYY]

Step 14 — Create Gender

Press **T**.

Add:

Gender

Then add:

○ Male ○ Female ○ Other

For a simple practical, the circles can be made using the **Ellipse tool**.

To create a circle:

1. Select Shape dropdown.
2. Select **Ellipse**.
3. Hold **Shift** while dragging.
4. Make a small circle.

But you can also simply use the text:

○ Male ○ Female ○ Other

That's sufficient for the practical.

Step 15 — Create Course field

Label:

Course

Create a rectangle:

[Select Course ▼]

The ▼ can simply be typed as text.

Step 16 — Create Password field

Label:

Password

Create:

[Enter password]

Step 17 — Create Register button

Press:

R

Draw a rectangle.

Approximate:

Width: 150 px

Height: 48 px

Then press:

T

Type:

REGISTER

Put the text inside the rectangle.

Step 18 — Add Terms checkbox

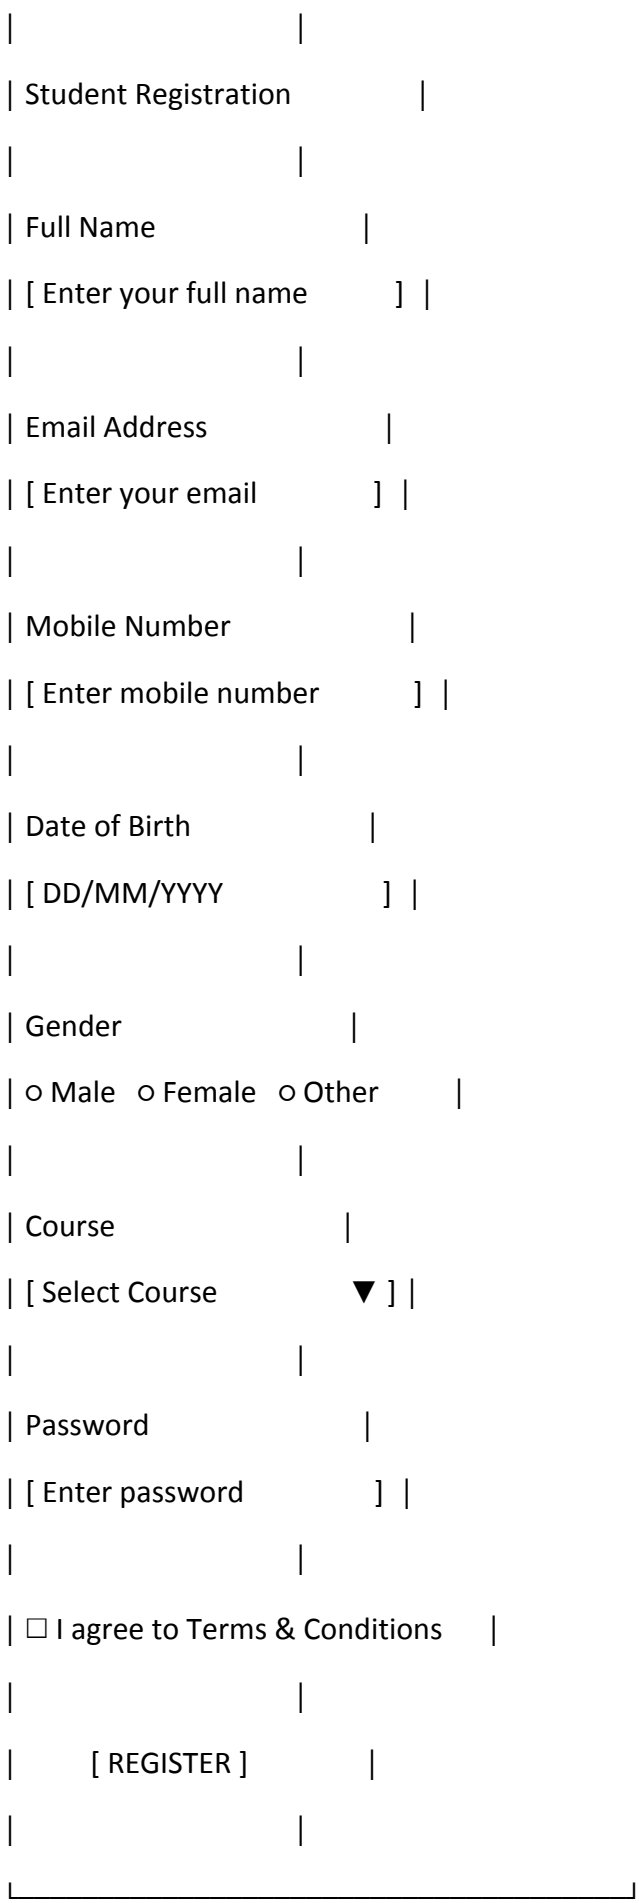

Add:

☐ I agree to the Terms & Conditions

Place it above the Register button.

Step 19 — Your Original Form should look approximately like this

This is **Frame 1**.

PART D — CREATE FRAME 2

Now we redesign the form using the **5 UI/UX principles**.

This is the most important part of your practical.

Step 20 — Duplicate the first frame

Select the entire:

01 - Original Form

You can click the frame boundary.

Then duplicate it.

Shortcut:

Ctrl + D

on Windows.

Move the duplicated frame to the right.

Rename it:

02 - Redesigned Form

Now you have:

01 - Original Form

02 - Redesigned Form

PART E — APPLY PRINCIPLE 1: CONSISTENCY

Step 21 — Set consistent font

Select your text elements.

Use:

Font: Inter

Use consistent sizes:

Heading = 28 px

Labels = 14 px

Input text = 14–16 px

Button = 14–16 px

Step 22 — Make input boxes consistent

All input fields should have approximately:

Width = 400 px

Height = 48 px

All should have:

Corner Radius = 8 px

To do this:

1. Click an input box.
2. Look at the right panel.
3. Find **Corner radius**.
4. Enter:

8

Repeat for all input boxes.

Step 23 — Make spacing consistent

Keep approximately:

Label

↓

8 px

Input box

↓

24 px

Next label

The exact value isn't extremely important.

The important thing is that the spacing is **consistent**.

PART F — APPLY PRINCIPLE 2: FEEDBACK

The user should know what happened after an action.

For this, we will create a separate error state.

Step 24 — Create Frame 3

Press:

F

Create another frame.

Set approximately:

Width: 1440

Height: 900

Rename it:

03 - Error Feedback

Step 25 — Copy the redesigned form

You can copy the redesigned form elements from Frame 2 and paste them into Frame 3.

Select the form elements.

Press:

Ctrl + C

Go to Frame 3.

Press:

Ctrl + V

Step 26 — Create an email error

Find:

Email Address

Change the placeholder to:

abc@gmail

Now below the field add:

Please enter a valid email address.

This is your **feedback**.

Step 27 — Make the error visually obvious

Select the email input border.

Change it to an error color such as red.

The important thing is:

Don't depend only on color.

You already have:

Please enter a valid email address.

Therefore the user understands the problem even if they cannot distinguish colors easily.

Step 28 — Add success feedback

You can also add a successful state.

For example:

✓ Email address is valid

or after registration:

Registration Successful!

Your account has been created successfully.

This demonstrates positive feedback.

PART G — PRINCIPLE 3: SIMPLICITY

Now improve the redesigned form.

Step 29 — Remove unnecessary elements

Ask yourself:

"Does the user really need this information?"

For our form, keep:

Full Name

Email Address

Mobile Number

Date of Birth

Gender

Course

Password

Terms & Conditions

Register

Don't add unnecessary fields such as:

Favorite Color

Favorite Food

Hobbies

Father's Name

Mother's Name

etc.

unless they are actually required.

Step 30 — Use simple labels

Use:

Full Name

Email Address

Mobile Number

Password

Avoid long labels such as:

Please provide your complete registered email address here

Simple = better UX.

PART H — PRINCIPLE 4: VISIBILITY

Step 31 — Make heading visible

Use:

Student Registration

at the top.

Make it approximately:

28 px

Bold

Step 32 — Make labels visible

Don't depend only on placeholders.

Use:

Email Address

[Enter your email]

instead of:

[Email]

The label remains visible even after the user starts typing.

Step 33 — Make Register button visible

The Register button should stand out.

Example:

```
┌──────────────────┐
|    REGISTER      |
└──────────────────┘
```

Use:

Width: 150 px

Height: 48 px

Make the text bold/semibold.

Step 34 — Add enough whitespace

Don't put everything tightly together.

Bad:

Name

[____]

Email

[____]

Phone

[____]

Better:

Name

[_____]

Email

[_____]

Phone

[_____]

Spacing makes the form easier to scan.

PART I — PRINCIPLE 5: ACCESSIBILITY

This is very important because the assignment specifically mentions accessibility.

Step 35 — Use readable font

Use:

Inter

Avoid extremely decorative fonts.

Body text should generally be around:

14–16 px

Step 36 — Use good contrast

Don't make your text:

Light gray on white

Use dark text on a light background.

For example:

Background → White

Text → Dark

Step 37 — Don't rely only on color

Bad:

Email

[abc@gmail] ← RED

A user may not understand why it is red.

Better:

Email

[abc@gmail]

Please enter a valid email address.

Step 38 — Use clear labels

Every input should have a label.

For example:

Email Address

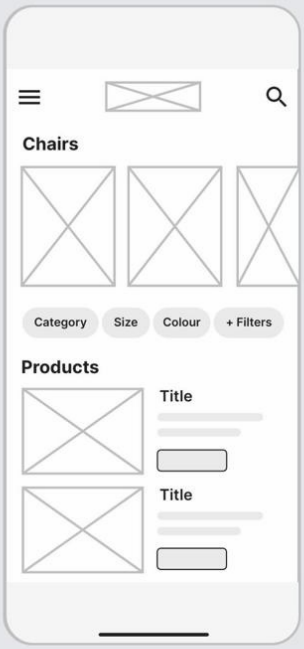

[Enter your email]

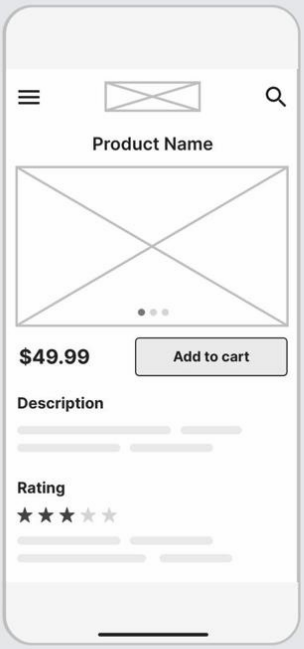

rather than:

[Enter your email]

Practical 3 — Wireframing & Interface Design

12

1. Understand what you have to do

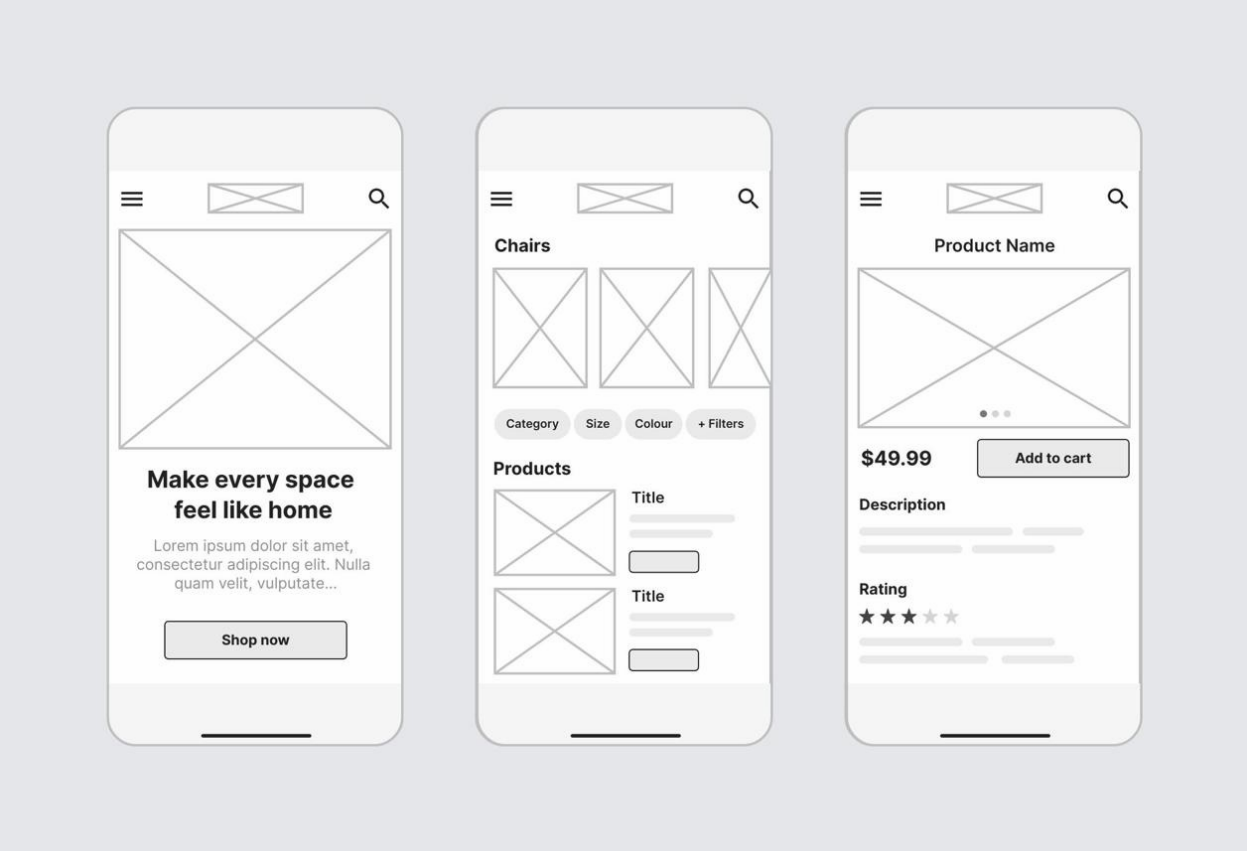

A wireframe is a basic outline of an application screen. It shows where the title, buttons, images, text, and navigation will be placed before you add final colors and decoration.

For this practical, you will create three mobile screens for a shopping app.

Screen 1 — Shop / Categories

A header, search icon, category names and product-category boxes.

Screen 2 — Product Listing

A title, category filters and products arranged in a two-column grid.

Screen 3 — Product Details

A product image, product name, description, price and Add to Cart button.

Software: Figma Coding required: No Output: Three digital wireframe screens and a user flow connecting them.

2. Open Figma and create your file

You already opened Figma in our previous steps, so you can continue in that file or create a new one.

1. Open Figma.
2. Click Design to create a new design file.
3. Rename the file to UIUX Practical - Wireframing.
4. Click the canvas and press F to activate the Frame tool.
5. On the right-side panel, set the frame dimensions to:
    - Width: 390
    - Height: 844
6. Rename the frame 01 - Shop Screen.

This is a mobile screen size suitable for your wireframe. If Figma offers a phone preset, you can select one instead.

3. Create Screen 1 — Shop / Categories

This screen is the first page of the shopping application.

Step 1: Create the header

1. Press T on your keyboard.
2. Click near the top of the phone frame.
3. Type Shop.
4. Set the font size to approximately 20 px and make it bold.
5. Add a search symbol or simply type Search on the right side.

Your header will look like:

Shop

Category Category Category

Step 2: Add category navigation

1. Press T.
2. Type Category Category Category.
3. Place it below the header.
4. Use approximately 12–14 px text.

These are placeholders for shopping categories.

Step 3: Add the category title

1. Press T.
2. Type Category Title.
3. Place it below the category navigation.
4. Use a 16 px bold font.

Step 4: Draw product image placeholders

1. Press R to select the Rectangle tool.
2. Draw a rectangle approximately 150 × 100 px.
3. Repeat to create a second rectangle beside it.
4. Add another row of two rectangles below.

These boxes represent product images. Since this is a low-fidelity wireframe, you do not need actual product photographs.

To make the boxes look like wireframe image placeholders, use the Line tool to draw two diagonal lines across each rectangle, forming an X.

Step 5: Add category names

Below each image placeholder, press T and add labels such as:

- Shoes
- Clothing
- Accessories
- Electronics

Step 6: Add bottom navigation

At the bottom of the phone frame, add:

Home Search Cart Profile

Use a thin line above the navigation to separate it from the content.

Your first screen is complete.

4. Create Screen 2 — Product Listing

This screen shows products after the user selects a category.

Step 1: Create another phone frame

1. Press F.
2. Create another frame of 390 × 844 px.
3. Place it to the right of Screen 1.

4. Rename it 02 - Product Listing.

Step 2: Add the header

Use the Text tool to add:

- A back arrow: ←
- Title: Products
- Search symbol or text: Search

Step 3: Add category filters

Below the header, add:

All Popular New Offers

These represent filters for the product list.

Step 4: Create the product grid

Draw four rectangles, arranged in two columns and two rows.

Use approximately 155 × 120 px for each image placeholder, adjusting the spacing to fit the frame.

Below each rectangle, add:

- Product Name
- 999
- Rating: 4.5

You can repeat the same layout for all four products.

Step 5: Add bottom navigation

Add:

Home Search Cart Profile

Keep it consistent with Screen 1.

Important: The purpose of a wireframe is to show the structure and placement of elements. Use mostly black, white and grey rather than spending time on final colors.

5. Create Screen 3 — Product Details

This screen opens when the user selects a product.

Step 1: Create the frame

1. Press F.
2. Create a third 390 × 844 px frame.
3. Place it to the right of Screen 2.

4. Rename it 03 - Product Details.

Step 2: Add the header

Add:

← Product Name Search

Step 3: Add the product image

1. Press R.
2. Draw a large rectangle approximately 340 × 250 px.
3. Center it below the header.
4. Add diagonal lines forming an X.

This is your product image placeholder.

Step 4: Add product information

Below the image, add:

- Product Name
- 1,499
- Rating: 4.5
- Description
- A short description, such as Comfortable, lightweight and suitable for everyday use.

Step 5: Add the Add to Cart button

1. Press R.
2. Draw a rectangle near the bottom of the screen.
3. Set it approximately 300 × 48 px.
4. Press T and type Add to Cart.
5. Center the text inside the button.

Your third screen is complete.

6. Connect the screens using a user flow

Your practical manual also mentions SET C: User flow. You can demonstrate it by connecting the screens in Figma.

01 — Shop

Select a category

02 — Product Listing

Select a product

03 — Product Details

View details and add to cart

How to connect them in Figma

1. Select Screen 1.
2. Open the Prototype tab in the right panel.
3. Select the relevant category area or a rectangle representing a category.
4. Drag the small prototype connection handle to Screen 2.
5. Select a product area in Screen 2 and connect it to Screen 3.
6. Set the interaction to On click → Navigate to the destination frame, if these options are available.
7. Click the Present/Play button to test the flow.

If you cannot find the prototype handle, finish the three screens first. The digital wireframes are the main part of the assignment; prototype connections are an additional demonstration of the user flow.

7. What the final Figma canvas should look like

Arrange the frames horizontally:

01 — Shop

Shop ⌕

Category Category

Home Search Cart

02 — Products

← Products

All Popular New

Product A

999

Product B

799

Product C

599

Product D

03 — Details

← Product

Product Name

1,499 · Rating 4.5

Description...

Add to Cart

Illustrative layout reference — recreate these elements in your actual Figma file.

8. What to write in your practical journal

Title: Assignment 2 — Wireframing & Interface Design

Aim: To create a low-fidelity wireframe for a shopping application and understand screen layout, element placement and user flow.

Software Required: Figma.

Procedure:

1. Identified the purpose of the shopping application.
2. Sketched the screen layouts on paper.
3. Created three mobile frames in Figma.
4. Designed the Shop/Category screen.
5. Designed the Product Listing screen.
6. Designed the Product Details screen.
7. Arranged the elements using boxes, lines and text labels.
8. Connected the screens to demonstrate the user flow.
9. Reviewed the layout and saved the design.

Result: Three digital wireframe screens were created for a shopping application.

Conclusion: Learned how to plan interface structure, arrange UI elements and represent a user flow using wireframes.

Sets mentioned in the manual:

- Set A: Paper wireframe
- Set B: Digital wireframe
- Set C: User flow

Practical 4 — Responsive & Visual Design

1. Aim

To design a responsive news website for desktop, tablet, and mobile screens by applying visual design principles such as colour, typography, alignment, spacing, and layout.

2. Objectives

- Understand responsive design and its importance.
- Create layouts for different screen sizes.
- Apply visual design principles.
- Maintain readability and consistency.
- Learn to arrange interface elements using Figma.

3. Software and requirements

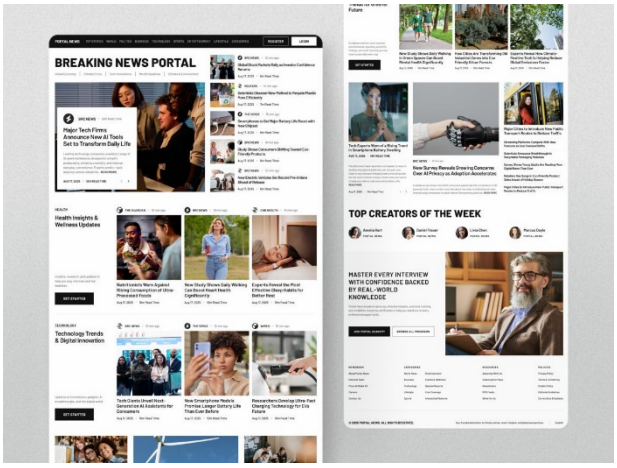

- Figma — for interface design.
- Google Chrome or another web browser.
- Laptop or desktop computer.
- Internet connection.

4. Theory

Responsive design is an approach to designing websites that adapt to different screen sizes. A responsive website should remain readable and usable on a mobile phone, tablet, and desktop.

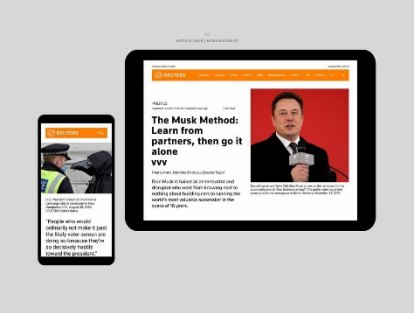

Visual design focuses on the appearance and arrangement of interface elements. It includes colour, typography, spacing, contrast, alignment, and visual hierarchy.

For this practical, we will design a news website called Daily News in three layouts.

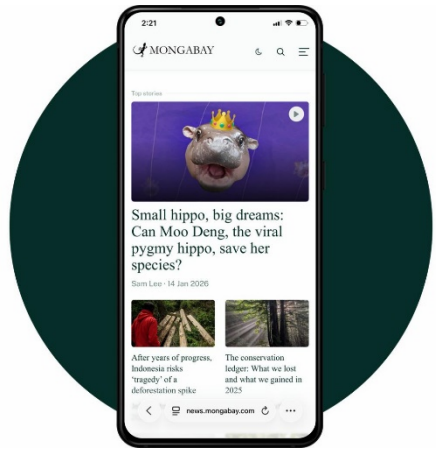

Desktop layout

Width: 1440 px. Includes full navigation, a featured article, a sidebar and multiple news cards.

Tablet layout

Width: 768 px. Uses compact navigation and fewer columns.

Mobile layout

Width: 390 px. Uses a compact header and vertically stacked articles.

These are visual references. You will create the actual layouts in Figma.

5. Procedure — Step-by-step in Figma

Step 1: Create a new Figma file

1. Open Figma.
2. Click Design to create a new design file.
3. Rename the file UIUX Practical 4 - Responsive and Visual Design.
4. Click the canvas to begin designing.

Step 2: Create the desktop frame

1. Press F on your keyboard to activate the Frame tool.
2. Draw a frame on the canvas.
3. Select the frame.

4. In the right-side Design panel, set:
    - Width: 1440 px
    - Height: 1000 px
5. Rename it 01 - Desktop News Page.

A frame is a container representing a screen or webpage.

Step 3: Set the background

1. Select the frame.
2. Find Fill in the right panel.
3. Set the background colour to #F8FAFC.
4. Keep the main content area white.

This light background provides contrast without distracting from the news content.

Step 4: Design the header

The header contains the website name and navigation menu.

1. Press R to select the Rectangle tool.
2. Draw a rectangle across the top of the frame.
3. Set its height to approximately 80 px.
4. Set its fill colour to #172554 (navy blue).
5. Press T to add text.
6. Type DAILY NEWS.
7. Set the font to Inter, size 24 px, and make it bold.
8. Change the text colour to white.
9. Add navigation labels on the right:

Home | World | Technology | Sports | Business

10. Use white text at approximately 14–16 px.

Keep the logo and navigation aligned vertically within the header.

Step 5: Create the featured article

1. Below the header, leave approximately 32 px of space.
2. Press R and draw a large rectangle for the featured article image.
3. Add a headline below it:

Technology Is Changing the Future

4. Set the headline to approximately 30 px and bold.
5. Add a short description:

   Discover the latest developments in technology, innovation and digital life.

   6. Add the byline:

   By News Desk | 22 October 2026

   7. Arrange the image, headline, description and byline vertically.

   The large headline should attract attention before the reader sees the smaller details.

   Step 6: Create the Latest News sidebar

   On the right side of the desktop layout:

1. Add the heading Latest News.
2. Create three smaller article blocks.
3. Add a small image placeholder to each block.
4. Add a short headline beside or below each image.

   Example headlines:

- New AI Tools Transform Education
- Global Business Updates
- Latest Sports Headlines

  Keep the sidebar narrower than the featured article area.

  Step 7: Create the More News section

1. Below the featured article area, add the heading More News.
2. Create three rectangular article cards in one row.
3. Add an image placeholder to each card.
4. Add a short headline and a brief description below each image.
5. Keep the card widths and spacing consistent.

   Your desktop page should now contain a header, featured story, Latest News sidebar and More News cards.

   6. Create the tablet layout

   Step 8: Create the tablet frame

1. Press F.
2. Create another frame.
3. Set its dimensions to 768 × 1024 px.

4. Rename it 02 - Tablet News Page.
5. Place it beside the desktop frame.

Step 9: Adapt the header

1. Use a smaller logo, approximately 20 px.
2. Reduce the number of visible navigation items if necessary.
3. Reduce the horizontal gaps between navigation items.
4. Ensure the header fits within the tablet frame.

Step 10: Adjust the content

1. Reduce the side margins to approximately 24 px.
2. Resize the featured image to fit the available width.
3. Reduce the headline to approximately 24 px.
4. Move the Latest News section below the featured story or use a narrower sidebar if it fits.
5. Display the More News cards in two columns instead of three.

   Expected result: The tablet layout should feel less crowded than the desktop layout while preserving the main content.

7. Create the mobile layout

Step 11: Create the mobile frame

1. Press F.
2. Set the frame to 390 × 844 px.
3. Rename it 03 - Mobile News Page.

Step 12: Design the mobile header

1. Place DAILY NEWS at the top left.
2. Set its font size to approximately 18–20 px.
3. Add a menu icon on the right.
4. Remove the full horizontal navigation menu.

   The compact header saves space on the narrow screen.

Step 13: Adjust the featured article

1. Set the left and right content margins to approximately 16 px.
2. Resize the featured image to fit the content width.

3. Set the headline to approximately 22–24 px.
4. Set body text to approximately 14–16 px.
5. Place the description and byline below the headline.

   Make sure text wraps naturally and does not extend outside the frame.

   Step 14: Stack the news cards

1. Move Latest News below the featured article.
2. Arrange the news cards vertically, one per row.
3. Use a small thumbnail on the left and headline on the right, or put the image above the headline.
4. Keep approximately 16 px between sections.
5. Ensure all text and images fit within the mobile frame.

   This demonstrates how a multi-column desktop layout becomes a single-column mobile layout.

   8. Apply visual design principles

   Step 15: Apply a consistent colour palette

   Use the same colours throughout all three designs.

   Navy blue — #172554

   Header and important visual elements.

   Light grey — #F8FAFC

   Page background.

   White — #FFFFFF

   Article cards and content areas.

   Dark grey — #1F2937

   Headlines and body text.

   To apply a colour, select the element, find Fill in the right panel, click the colour swatch and enter the hex value.

   Step 16: Apply typography

   Typography is the arrangement and styling of text.

   Use a font such as Inter with a clear hierarchy.

Element	Suggested size
Website logo	20–24 px

Desktop main headline	28–32 px
Section heading	20–24 px
Article headline	16–18 px
Body text	14–16 px
Metadata and dates	12–14 px

Use bold text for important headings and regular text for descriptions.

Step 17: Improve spacing and alignment

- Align article cards and headings consistently.
- Keep equal spacing between similar cards.
- Avoid placing too many elements close together.
- Maintain consistent margins around content.
- Keep images aligned with their associated headlines.

Step 18: Use Auto Layout

Auto Layout helps organize elements and manage spacing.

1. Select related elements, such as the contents of one article card.
2. Press Shift + A.
3. In the right panel, choose a vertical layout for elements stacked from top to bottom.
4. Set spacing between elements to approximately 8 px.
5. Add padding around the content, such as 16 px.
6. Repeat for other cards where useful.

Use Fill container when available for an element that should occupy the available width inside an Auto Layout parent.

Step 19: Check accessibility

Check that:

- Text is readable at each screen size.
- Text and background have sufficient contrast.
- Headlines wrap without clipping.
- Navigation is understandable.

- Interactive elements are sufficiently large and spaced.
- Important information is not communicated by colour alone.

9. Final testing and export

Step 20: Test the three frames

Review each frame separately:

- Desktop: the navigation, sidebar and cards fit.
- Tablet: the layout adapts without crowding.
- Mobile: content stacks vertically without horizontal overflow.
- All frames: colours, typography and spacing remain consistent.

Step 21: Export the designs

1. Select 01 - Desktop News Page.
2. Find Export in the right-side Design panel.
3. Click +.
4. Choose PNG and export the frame.
5. Repeat for the tablet and mobile frames.

   Keep all three screenshots for your practical journal.

Homepage Layout Design Using UI/UX Principles

Aim: To design a homepage layout by applying Gestalt principles, colour theory, and typography using Figma.

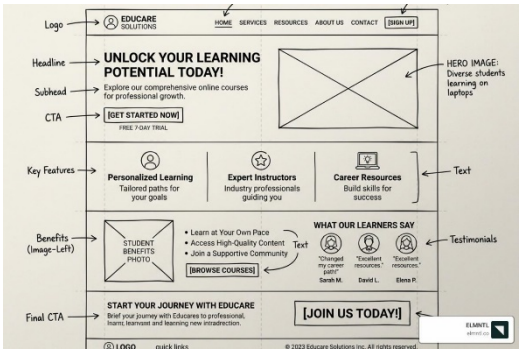

1. Software Required

- Figma
- Web browser

2. Theory

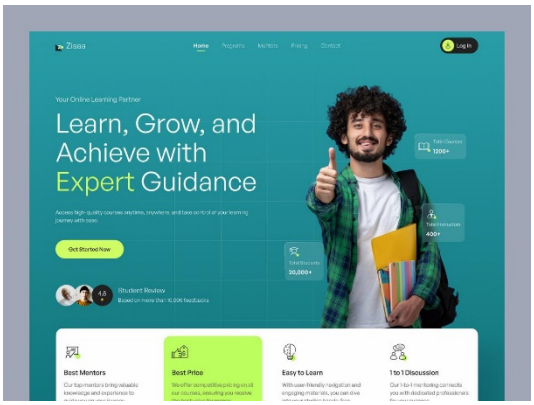

- Gestalt principles: Organize related elements together to make the design easy to understand.
- Colour theory: Use suitable colours to create a consistent and attractive interface.
- Typography: Select readable fonts, sizes, and weights for headings and content.
- Visual hierarchy: Make important information more noticeable than less important information.

3. Procedure in Figma

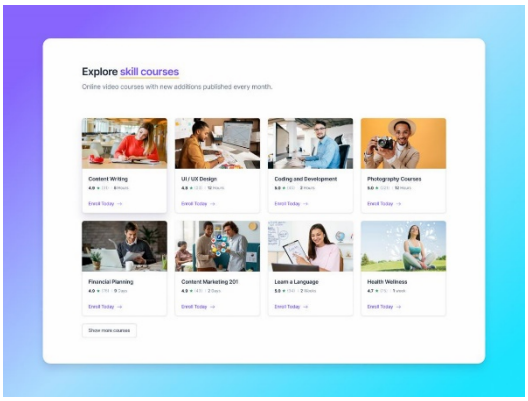

Step 1: Create a new design

Open Figma and create a new design file. Press F and select a desktop frame, such as 1440 × 900 px. Rename it Homepage Design.

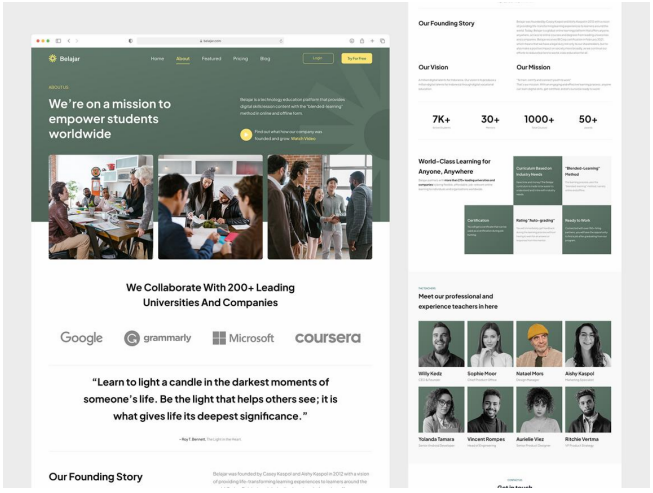

Step 2: Design the header and hero section

Add the institute name, navigation links, a main heading, a short description, and an Explore Courses button. Use the Text tool (T) and Rectangle tool (R).

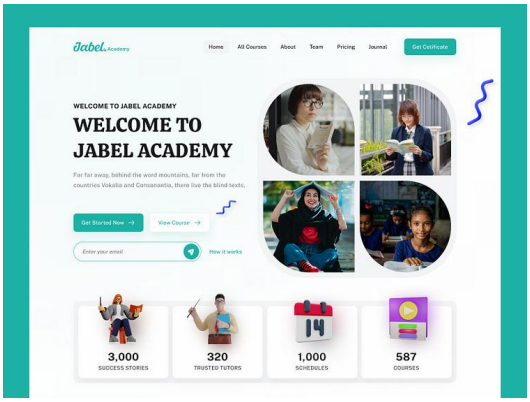

Step 3: Add course cards

Create three cards for Web Development, Graphic Designing, and Data Analytics. Keep their spacing, alignment, and structure consistent.

Step 4: Add remaining sections

Include an About section, a call-to-action button, and a footer with contact information and social links.

Step 5: Apply UI/UX principles

Use consistent spacing, readable typography, grouped content, and a clear visual hierarchy. For a Tech Alpha-style design, try teal #00B39F, gold #FFC107, and purple #6E258C.

5. Result

A homepage layout was designed using Figma by applying Gestalt principles, colour theory, typography, consistency, and visual hierarchy.

Accessible Form Page Design

Aim: To redesign a form interface using accessibility principles to improve readability, usability, and ease of interaction.

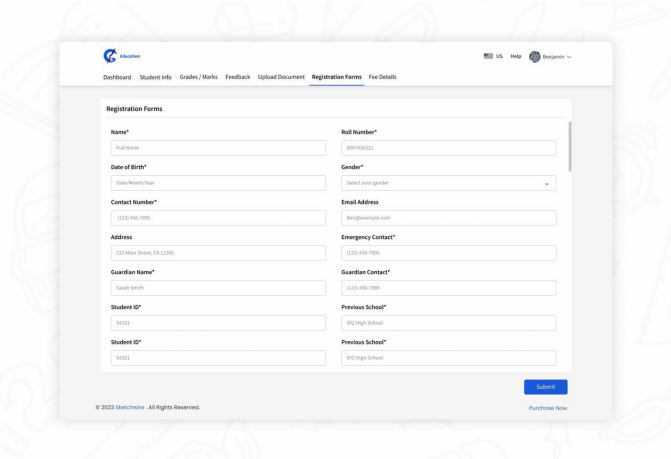

1. Software Required

- Figma
- Web browser

2. Theory

Accessibility in UI/UX design helps people with different abilities use a digital interface. An accessible form should have readable text, sufficient colour contrast, clear labels, understandable error messages, and visible interactive controls.

3. Procedure in Figma

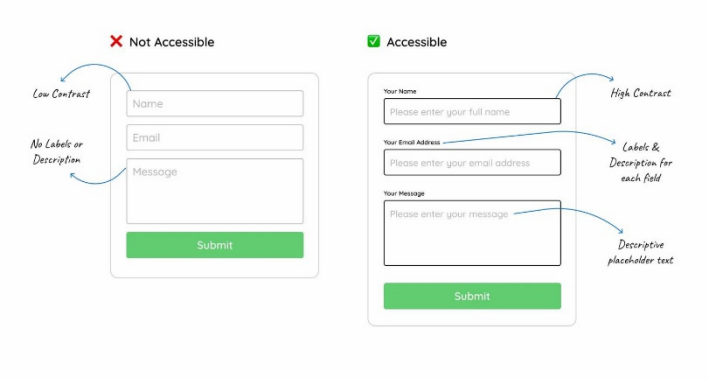

Step 1: Create a form frame

Open Figma and create a desktop frame or a mobile frame. Name it Accessible Registration Form.

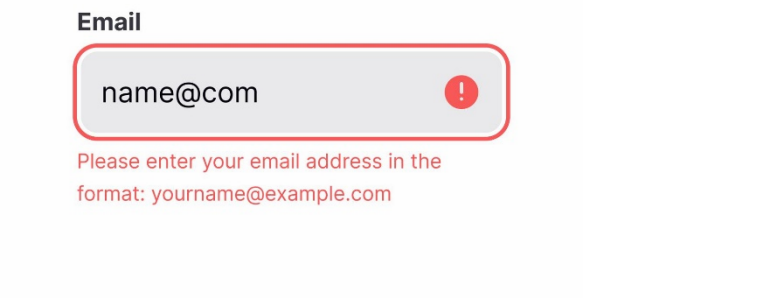

Step 2: Add form fields

Add a heading, Full Name, Email Address, Password, and a Submit button. Place a visible label above each input field.

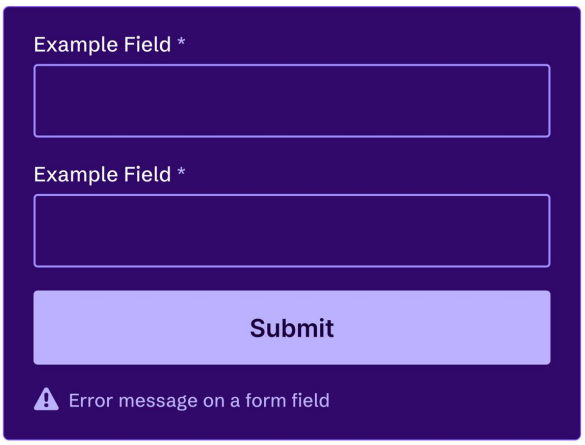

Step 3: Improve readability

Use a readable font such as Arial or Inter. Keep body text around 16 px, use clear headings, and maintain sufficient contrast between text and background.

Step 4: Design error feedback

Create a second form state showing an invalid email address. Add a clear message such as “Please enter a valid email address.” Do not rely on colour alone to communicate an error.

Step 5: Check accessibility

Ensure fields and buttons are large enough to use comfortably, labels are clear, spacing is consistent, and focus or selected states are visible. For real websites, images also need appropriate alternative text.
